Executive Summary

- Summary of methodologies
- 1. Data Collection SpaceX API
- 2. Data Collection with Web Scraping
- 3. Data Wrangling
- 4. Data Exploratory Data Analysis
- 5. EDA DataViz
- Summary of all results
- 1. EDA Results
- 2. Interactive Visual Analytics and Dashboards

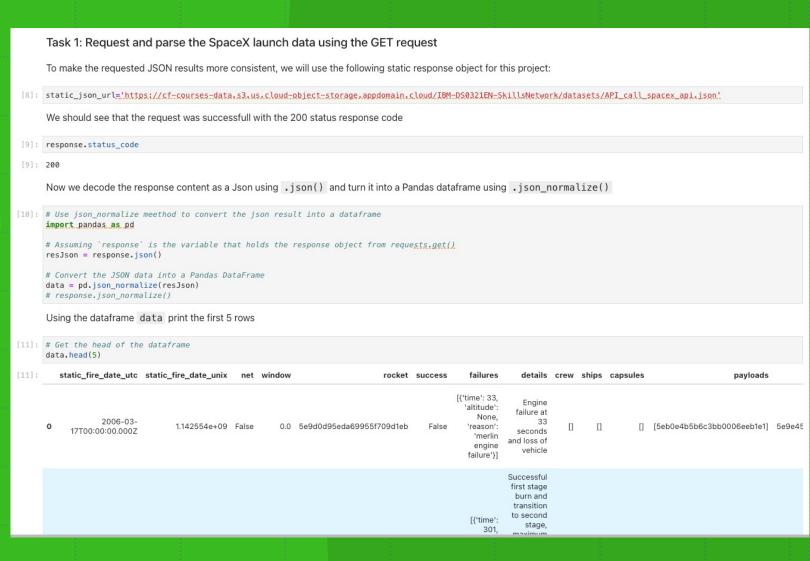

Introduction

SpaceX advertises Falcon 9 rocket launches on its website with a cost of 62 million dollars; other providers cost upward of 165 million dollars each, much of the savings is because SpaceX can reuse the first stage. Therefore if we can determine if the first stage will land, we can determine the cost of a launch. This information can be used if an alternate company wants to bid against SpaceX for a rocket launch

Data Collection

Data collected from public website starlink space X Falcon 9. To get the data clear without noise data is normalize using *json_normalize()*

```
[3]: FlightNumber
                        0.000000

```

Data Wrangling

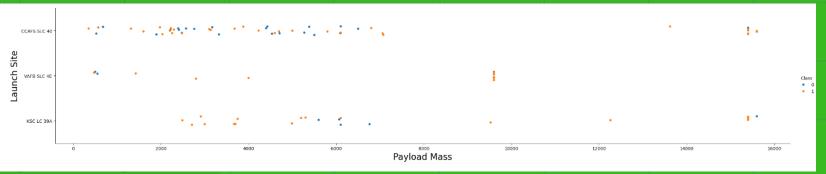

With data wrangling, exploratory data is started with check available nullable data and check data type in each columns.

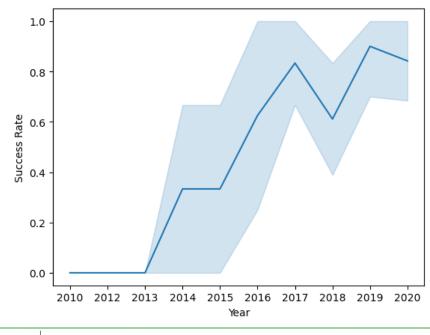

EDA with Data Visualization

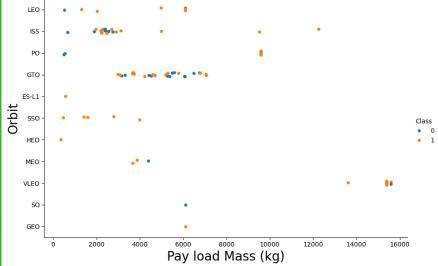

- 1. Performed data Analysis and Feature Engineering using Pandas and Matplotlib i.e *Exploratory Data Analysis* and *Preparing Data Feature Engineering*
- 2. Used scatter plots to Visualize the relationship between Flight Number and Launch Site, Payload and Launch Site, FlightNumber and Orbit type, Payload and Orbit type.
- 3. Used Bar chart to Visualize the relationship between success rate of each orbit type
- 4. Line plot to Visualize the launch success yearly trend

EDA with Data Visualization (Contd..)

EDA with SQL

Display the names of unique launch sites

```
[10]: %sql SELECT DISTINCT ST.Launch_Site FROM SPACEXTABLE ST

* sqlite:///my_data1.db
Done.

[10]: Launch_Site

CCAFS LC-40

VAFB SLC-4E

KSC LC-39A

CCAFS SLC-40
```

Display 5 records begin with string CCA

%sql SELECT * FROM SPACEXTABLE ST WHERE ST.Launch_Site LIKE 'CCA%' LIMIT 5												
* sqlite:///my_data1.db Done.												
Date	Time (UTC)	Booster_Version	Launch_Site	Payload	PAYLOAD_MASSKG_	Orbit	Customer	Mission_Outcome	Landing_Outcome			
2010- 06-04	18:45:00	F9 v1.0 B0003	CCAFS LC- 40	Dragon Spacecraft Qualification Unit	0	LEO	SpaceX	Success	Failure (parachute)			
2010-12- 08	15:43:00	F9 v1.0 B0004	CCAFS LC- 40	Dragon demo flight C1, two CubeSats, barrel of Brouere cheese	0	LEO (ISS)	NASA (COTS) NRO	Success	Failure (parachute)

Display average payload mass with carried by booster version F9 v1.1

```
Display average payload mass carried by booster version F9 v1.1

[20]: %sql SELECT AVG(PAYLOAD_MASS_KG_) FROM SPACEXTABLE WHERE Booster_Version = 'F9 v1.1'

* sqlite:///my_datal.db
Done.

[20]: AVG(PAYLOAD_MASS_KG_)

2928.4
```

Build an interactive map with folium

Calculate Distance between the coastline point and the launch site

```
coast_coordinates = [coastline_lat, coastline_lon]
distance_marker = folium.Marker(
    coast_coordinates,
    icon=DivIcon(
        icon_size=(20,20),
        icon_anchor=(0,0),
        html='%s' % "{:10.2f} KM".format(distance_coastline),)
distance_marker.add_to(site_map)
site_map
                                                                                                                                                                    Lat: 43.58039 Long: -78.04688
```

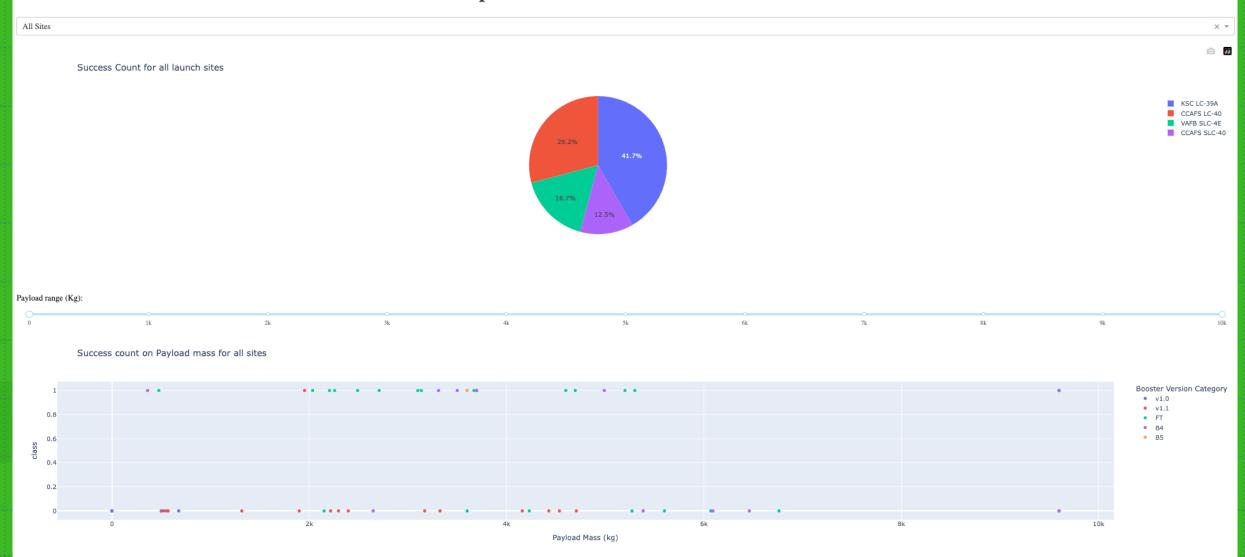

Build a Dashboard with Plotly Dash

Built an interactive dashboard application with Plotly dash by:

- a. Adding a Launch Site Drop-down Input Component
- b. Adding a callback function to render success-pie-chart based on selected site dropdown
- c. Adding a Range Slider to Select Payload
- d. Adding a callback function to render the success-payload-scatter-chart scatter plot

SpaceX Dash App

SpaceX Launch Records Dashboard

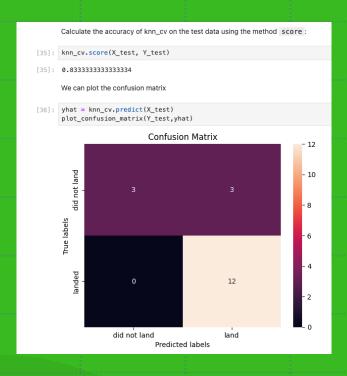

Predictive Analysis

In order to find the best ML model/ method that would performs best using the test data between SVM, Classification Trees, k nearest neighbors and Logistic Regression;

- 1. First created an object for each of the algorithms then created a GridSearchCV object and assigned them a set of parameters for each model.
- 2. For each of the models under evaluation, the GridsearchCV object was created with cv=10, then fit the training data into the GridSearch object for each to Find best Hyperparameter.
- 3. After fitting the training set, we output GridSearchCV object for each of the models, then displayed the best parameters using the data attribute best_params_ and the accuracy on the validation data using the data attribute best_score_.
- 4. Finally using the method score to calculate the accuracy on the test data for each model and plotted a confussion matrix for each using the test and predicted outcomes.

Summary

The table below shows the test data accuracy score for each of the methods comparing them to show which performed best using the test data between SVM, Classification Trees, k nearest neighbors and Logistic Regression;

Thanks
